

Dear Lightsource bp Hiring Team,

I am applying for the Geospatial Analyst position at Lightsource bp. I have five years of experience using GIS and spatial analysis to support city planning, and I earned an MSc in Urban Spatial Science from CASA UCL. I am drawn to this role because it combines in-depth geospatial work with the chance to make a real environmental difference, which is important to me both at work and in my personal life.

I have worked with QGIS and ArcGIS on many hands-on projects. At Derman Verbakel Architecture in Tel Aviv, I led geo-computational tasks such as mapping, site feasibility studies, market analysis, and profitability modeling for fifteen projects with both municipal and private clients. I managed large geospatial datasets, ensured data quality, and created reports and visualizations for planning committees and developers. These experiences are similar to the data management and stakeholder engagement needed for this role. I also trained colleagues in GIS and created workflows that made our office 30% more efficient.

For my MSc dissertation with CACI Ltd, I built a Python-based analysis pipeline using GeoPandas, scikit-learn, and spatial autocorrelation to model retail spending patterns across the country. This project gave me hands-on experience in building automated, repeatable geospatial workflows, which matches the process improvement and automation skills Lightsource bp is looking for.

While I am new to the renewable energy field, I have used geospatial skills like site selection, data integration, feasibility analysis, and stakeholder communication throughout my career. I am inspired by Lightsource bp's mission and would bring the same care and attention to detail to support your projects in the UK and Ireland.

Thank you for considering my application.

Sincere regards,

Emily Deeb
